New thermostable AviIII peptide from Acidothermus cellulolyticus, useful for degradation of cellulose or in generating anti-AviIII antibodies for purifying recombinant AviIII polypeptides from genetically engineered host cells.

Claim 6; Page 8; 44pp; English.

The present sequence is derived from a thermostable avicelase, designated AviIII. AviIII is a member of the glycoside hydrolase family of enzymes, and is a cellulase. AviIII is useful in the conversion of biomass to biofuels and biofuel additives. It may be useful in the production of detergents, pulp and parer processing, food and feed processing not textile processes. The thermostable AviIII peptide is useful in the degradation of cellulose, and in generating specific anti-AviIII antibodies that are useful in purifying recombinant AviIII polypeptides from genetically engineered host cells, in detecting AviIII polypeptide expression, as well as a reagent tool for characterizing the molecular actions of the polypeptide. The AviIII polynucleotide is useful as a

The polynucleotide is useful for detection of a polynucleotide encoding Avilli. The polynucleotide is useful for reducing cellulose in a starting material which involves administering to the starting material, e.g. agricultural biomass or municipal solid waste, a polypeptide molecule of the polynucleotide. Method further comprises administering a second polypeptide molecule chosen from the glycoside hydrolase family of proteins. The present sequence represents the amino acid sequence of Acidothermus cellulolyticus avicelase Avilli catalytic domain. Gaps ö Length 740; Indels 100.0%; Score 4036; DB 7; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated thermal tolerant avicelase polynucleotide useful for detection of a polynucleotide encoding AviIII and for reducing cellulose in a starting material, e.g. municipal solid waste.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polynucleotide molecule encoding thermostable AvilII polypeptide. The polynucleotide is useful for detection of a polynucleotide encoding AviIII. The polynucleotide is useful for reducing cellulose in starting material which involves administering to the starting material, e.g. agricultural biomass or municipal solid waste, a polypeptide molecule of the polynucleotide. The method further comprises administering a second polypeptide molecule chosen from the glycoside hydrolase family of proteins. The present sequence represents the amino acid sequence of Acidothermus cellulolyticus avicelase AviIII catalytic domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a thermostable avicelase polypeptide, designated AviIII. AviIII is a member of the glycoside hydrolase family of enzymes, and is a cellulase. AviIII su useful in the conversion of biomass to biofuels and biofuel additives. It may be useful in the production of detergents, pulp and parer processing, food and feed processing and in textile processes. The thermostable AviIII peptide is useful in the degradation of cellulose, and in generating specific anti-aviIII antibodies that are useful in purifying recombinant AviIII polypeptides from genetically engineered host cells, in detecting AviIII polypeptide expression, as well as a reagent tool for characterizing the molecular actions of the polypeptide. The AviIII polymucleotide is useful as a source of probes or primers in various diagnostic assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         106

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a xyloglucanase enzyme, belonging to family 74 of glycosyl hydrolases. The enzyme is isolated from Jonesia sp. DSM14140. The enzyme is useful in processes for machine treatment of fabrics. It is also useful in the textile industry for improving the properties of cellulosic fibers, yarn, woven or non-woven fabric, and in the cellulose fiber process step. The xyloglucanase enzyme is also useful in the cellulose fiber processing industry for ratting of fibers such as hemp, jute, flax and linen. It is useful for preventing binding of certain soils to the xyloglucan left on the cellulosic material
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GMGERLAVDPNNDNILYFGAPSGKGLWRSTDSGATWSQMTNFPDVGTYIANPTDTTG-YQ 184

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated thermal tolerant avicelase polynucleotide useful for detection of a polynucleotide encoding AviIII and for reducing cellulose in a starting material, e.g. municipal solid waste.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polynucleotide molecule encoding thermostable Avili polypeptide. The polynucleotide is useful for detection of a polynucleotide encoding Avilii. The polynucelotide is useful for reducing cellulose in a starting material which involves administering to the starting material, e.g. agricultural biomass or municipal solid waste, a polypeptide molecule of the polynucleotide. The method further comprises administering a second polypeptide molecule chosen from the glycoside hydrolase family of proteins. The present sequence represents the amino acid sequence of Aspergillus aculeatus

A transformed cell or organism having reduced or enhanced activity of at least one such protein e.g. galactomannanase can be generated by directing the gene encoding the protein. The activity of the protein is reduced by the presence of an antisense nucleic acid sequence. The nucleic acid sequence of the gene
                                                                                                                                                548

                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides having Family 74 xyloglucanase activity, and encoding nucleic acid molecules, useful for degrading cellulose-and hemicellulose containing biomass to ethanol or as a detergent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a Family 74 xyloglucanase (ADD42055) from the fungus Trichoderma reesei (Hypocrea jecorina), and nucleic acids encoding it (e.g., ADD42054). The enzyme hydrolyses the beta-1,4-glycosidic linkages in the backbone of xyloglucan to xyloglucan oligosaccharides. The invention also relates polypeptide sequences at least 70% identical to the enzyme, expression vectors and host cells comprising a nucleic acid of the invention, the recombinant production of the enzyme, and mutant enzymes and the nucleic acids encoding them. The xyloglucanase of the invention can be used in the degradation of cellulose- and hemicellulose-containing biomass to produce ethanol. It can also be used in a detergent composition for treating fabric during a machine washing cycle. The present sequence represents the Trichoderma reesei Family 74
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        313
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            373
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             433
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NMPGRGMGERLAVDPNNDNILYFGAPSGKGLWRSTDSGÅTWSQMTNFPDVGTYIANPTDT 180

```
encoding the protein is a recombinant sequence having at least one mutation as compared to the wild-type gene encoding the protein. The transgenic cell or microrganism are useful for producing xanthan gum, which are useful for providing formulations and properties, such as longterm suspension and emulsion stability in alkaline, acid, and salt solutions, temperature resistance, and pseudoplasticity. The present sequence represents an enzyme relating to the present invention.
                                                                                                                                                                                                                                                                         120

```
the invention relates to an isolated mucletic actu comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway or required for proliferation, or that inhibits proliferation or the biological pathway in which a proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the culture or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this contraction, the partial genes. Note: The sequence data for this contraction, the partial genes. Note: The sequence data for this contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1214
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1215 NGTVIVATATDPTGNTGPQAATTVDAVAPPAPVIDPSNGTTISGTAEAGAKVILTDGNGN 1274

Identifying modulators of microbial resistance of organisms in biofilms, e.g. inhibitor of biofilm formation, by employing expression controls, or efflux pumps containing polypeptides, of genes associated with biofilm

Claim 33; Fig 7; 102pp; English.

The present invention relates to a method of identifying a compound capable of altering the sensitivity of a microorganism to an antimicrobial agent by employing efflux pumps compurising polypeptides encoded by the following genes: PA1874, PA4142, PA2389, PA1876, PA4143, PA2390 or PA163. The method is useful for identifying modulators of microbial resistance of an organism in a biofilm. The methods are also useful for identifying genes that encode proteins that play a role in biofilm resistance. The method is particularly useful for screening compounds or discovering compositions that will inhibit biofilm formation and overcome their resistance mechanisms. These methods are particularly useful in medical, industrial or natural settings, where formation of biofilms can have serious negative consequences and result in high costs both in human health and economic terms. The present sequence is a protein shown in the exemplification of the invention

the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(I) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid comprising a promoter operably linked to the nucleic acid conciding a promoter operably linked to the nucleic acid conciding a propertied by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an acclivity against a biological pathway capaired for proliferation, or that inhibits cellular proliferation; (8) dentifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a
                                                                                                                                                                                                                                                                                   1819

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated Acinetobacter baumannii nucleic acids and polypeptides are useful as reagents accids and polypeptides are useful as reagents acciding a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii inflection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid comprising any one of the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense unclaic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for publication or that inhibits proliferation, (8) identifying a gene capacity or that inhibits proliferation of an organism acts; (9) manufacturing an antibioic; (10) profiling a compound, activity; (11) a culture comprising strains in which the gene or which he each of the strains is present in a culture or collection of an organism. The antisense nucleic acids required converting or streaming for homologous nucleic acids required converting proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation to isolate candidate molecules for this or the terget prokaryotic essential genes. Note: The sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent in a contract of the printed specification, but was obtained contractive for proliferation to isolate capacitication, but was obtained contractive contractives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     209

proliferation, (1) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the confiferation of an organism. The antisense nucleic acids required for callular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
proliferation or the activity of a gene in an operon required for ftp.wipo.int/pub/published_pct_sequences

Aypothetical protein slr1028 - Synechocystis sp. (strain PCC 6803)
C;Species: Synechocystis sp.
A;Variety: PCC 6803
C;Arziety: PCC 6803
C;Accession: S75251
R;Kaneko, T.; Sato, S.; Kotani, H.; Tanaka, A.; Asamizu, E.; Nakamura, Y.; Miyajima, N.; R;Kaneko, T.; Sato, S.; Ehimpo, S.; Takeuchi, C.; Wada, T.; Watanabe, A.; Yamada, M.; Yasuda, DNA Res. 3, 109-136, 1996
A;Title: Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis.
                                                                                                                                                                                                                                                                                                                                                     *;

-i- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
-i- SIMILARITY: Contains 4 like domains.
-i- SIMILARITY: Contains 1 C-type lectin family domain.
-i- SIMILARITY: Contains 1 Sushi (SCR) domain.
-i- SIMILARITY: Belongs to the aggrecan/versican proteoglycan family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DOMAIN: Two globular domains, G1 and G2, comprise the amino terminus of the proteoglycan, while another globular region, G3, makes up the COOH terminus. G1 contains link domains and thus consists of three disulfide-bonded loop structures designated as the A, B, B motifs. G2 is similar to G1. The keratan sulfate (KS) and the chondroitin sulfate (CS) attachment domains lie between G2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=86250698; PubMed=2424893;

I. FUNCTION: This proteoglycan is a major component of extracellular matrix of cartilagenous tissues. A major function of this protein is to resist compression in cartilage. It binds avidly to hyluronic acid via an amino-terminal globular region. May play a regulatory role in the matrix assembly of the cartilage.
I. SUBUNIT: Interacts with FBLNI (By similarity).
-: SUBCELLULAR LOCATION: Secreted; extracellular matrix (By

The repeat-containing domain may be involved in anchoring components of the pore complex to the pore membrane. SUBUNIT: Interacts with SENP2 (By similarity).
SUBCELLULAR LOCATION: Nuclear pore complex. Located to the terminal ring structure of the nucleoplasmic cage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            REPEATS

-!- FUNCTION: Salivary mucin that is thought to contribute to the lubricating and viscoelastic properties of whole saliva.

-!- FUNCTION: Salivary mucin that is thought to contribute to the C.:- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Expressed mainly in bronchus glands and also contributed and pancreas.

-!- FTM: Highly glycosylated.

-!- FTM: Highly glycosylated.

-!- SIMILARITY: Contains 1 TIL (Trypsin inhibitory-like) domain.

-!- SIMILARITY: Contains 4 VWFC domains.

-!- SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
